

TAILORED OVERVIEW FOR EYEQ MONITORING

Revenue operations for AI-enabled monitoring providers.

Rev.io gives EyeQ a unified operating layer for recurring monitoring revenue: billing, contract changes, payments, service workflows, customer hierarchy, and AI-assisted visibility across the business.

- Built for recurring service scale
- Billing + payments foundation
- Connected service operations

EyeQ brings together AI-powered video monitoring, a U.S.-based SOC, proactive virtual guard response, dealership business intelligence, and efficiency for property-heavy businesses. Rev.io helps turn that recurring-service model into accurate billing, cleaner payments, and connected operational workflows.

Why Rev.io fits the model

Monitoring providers package hardware, software, SOC response, reporting, and customer operations into managed services that need to invoice accurately every month.

EYEQ SIGNAL

AI + SOC

AI-enabled video analytics, U.S.-based monitoring, response, and incident workflow.

OPERATING MODEL

Multi-site

EyeQ publicly cites 300+ U.S. dealerships plus commercial and property-heavy accounts.

REV.IO VALUE

Quote-to-cash

Contracts, recurring charges, add-ons, one-time work, payments, and collections in one flow.

DESIGN WORKFLOW

IPVM

IPVM design outputs can inform proposals, product configuration, implementation work, and recurring billing setup.

RECOMMENDED FOCUS

Help EyeQ scale recurring monitoring revenue without revenue leakage.

Rev.io Billing and Payments provide the foundation for accurate recurring invoices, smoother collections, and contract change control. Rev.io PSA can extend that value when installs, camera health work, service tickets, maintenance, or technician scheduling need to connect back to revenue. Best next step: a 30-minute working session on billing structure, contract changes, payments, and service operations scope.

REV.IO VALUE PROPOSITION

- One platform** Replace disconnected billing, payment, contract, and service workflows with one AI-native operating platform for service providers.
- Billing accuracy** Capture recurring, usage-based, site-based, device-based, and one-time charges as services are sold or changed.
- Cash flow** Automate payment collection, reduce manual accounts receivable work, and make recurring monitoring revenue easier to collect.
- Workflow automation** Connect account, ticket, project, invoice, and payment activity so operations can scale without adding back-office headcount at the same pace.

VALUE FOR EYEQ

Customer / site hierarchy	Dealership groups, property managers, and commercial accounts often have parent companies, multiple locations, different contacts, different service bundles, and different billing rules.
Bundle complexity	Virtual Guard, Virtual Service Advisor, SOC monitoring, analytics, business intelligence, incident reporting, equipment, audits, and maintenance can become clean products, packages, and contract terms.
Add / move / change control	New cameras, new rooftops, verified-response changes, reporting upgrades, or service tier changes should flow to billing without spreadsheet reconciliation.
Service-to-cash	If EyeQ performs installs, repairs, camera health checks, or field maintenance, Rev.io PSA can tie tickets, projects, time, parts, and billing together.
Design-to-revenue flow	IPVM camera layouts can become a cleaner path into quoting, product catalog setup, implementation work, monthly monitoring, and future service changes.

ALIGNMENT QUESTIONS

Confirm the workflows that matter most.

- How many active customer sites and monthly invoices?
- Do they bill per location, camera, service tier, event, or bundled contract?
- What system owns contracts, invoices, payments, and collections today?
- How often do services change after install?
- Are installs and maintenance handled by EyeQ teams, partners, or both?
- Where does IPVM output go after design: quote, proposal, CRM, spreadsheet, or billing?
